

Australian Climate Agencies are proud suppliers of Calorex Heat Pumps, who supply a full range of air to water Heat Pumps for indoor and outdoor applications. Calorex are Europe's no 1 heat pump manufacturer with over 25 years of manufacturing experience.

All their products are British designed and manufactured, built to withstand the rigours of a huge range of both domestic and commercial applications, including outdoor and indoor swimming pools and high temp for potable hot water in hotels and hospitals.

We were asked to take on a major project for the Pan Pacific Hotel group which own and operate a 5 star property in Perth, Western Australia.

We partnered with Project Air Conditioning to supply and install Calorex heat pumps into this CBD property which at the time was around 28 years old. The existing space heating and hot water boiler system was well past its prime.

Project Air Conditioning undertook the retrofit and installed the Calorex heat recovery equipment as well as project manage all the logistical challenges which are inherent with working in a fully occupied international hotel.

I cannot speak more highly of this company. From the word go, Project Air Conditioning took control of what was always going to be a challenging project and transformed the space heating and potable hot water infrastructure into an integrated effective and efficient system through their excellent installation techniques and high quality workmanship.

The Calorex equipment is state of the art technology but the finished product is only as good as those who can install and commission with high level competency.

Project Air Conditioning did this and more.

I would highly recommend Project Air Conditioning to anyone seeking a competent organisation to carry out mechanical and electrical installations of very valuable equipment.
